5. Use this folder to store course materials

# RStudio

Let's open RStudio

# Arithmetic

$$2+2$$

$$2-2$$

$$2*2$$

$$2/2$$

$$2^3$$

# Functions in R

- ▶ Functions: perform common tasks for us

# Functions in R

- ▶ Functions: perform common tasks for us
- ▶ General form:
  - ▶ `functionname(arguments)`

# Functions in R

- ▶ Functions: perform common tasks for us
- ▶ General form:
  - ▶ `functionname(arguments)`
- ▶ Getting help for functions:
  - ▶ `?functionname`
  - ▶ `args(functionname)`

# Common Functions

- ▶ `sqrt()` takes the square root of whatever you put inside of the parentheses

```
sqrt(4)
```

## Common Functions

- ▶ `sqrt()` takes the square root of whatever you put inside of the parentheses

```
sqrt(4)
```

- ▶ `c()`, or concatenate, combines everything within the parentheses into a vector

```
c(1,2,3)
```

## Common Functions

- ▶ `mean()` calculates the average of object within the parentheses

```
mean(c(1,2,3))
```

# Common Functions

- ▶ `mean()` calculates the average of object within the parentheses

```
mean(c(1,2,3))
```

- ▶ `median()` calculates the median of the object within the parentheses

```
median(c(1,2,3))
```

# Common Functions

- ▶ `mean()` calculates the average of object within the parentheses

```
mean(c(1,2,3))
```

- ▶ `median()` calculates the median of the object within the parentheses

```
median(c(1,2,3))
```

- ▶ `sum()` adds the values in the vector within the parentheses

```
sum(c(1,2,3))
```

# Common Functions

- ▶ `min()` calculates the minimum of a vector, and `max()` calculates the maximum

```
min(c(1,2,3))
```

```
max(c(1,2,3))
```

# Common Functions

- ▶ `summary()` gives a variety of these statistics for a vector

```
summary(c(1,2,3))
```

# Common Functions

- ▶ `summary()` gives a variety of these statistics for a vector

```
summary(c(1,2,3))
```

- ▶ `length()` gives the length of the object within the parentheses

```
length(c(1,2,3))
```

# Common Functions

- ▶ `unique()` will give all of the unique values in a vector within the parentheses

```
unique(c(1,2,3,1,2,3))
```

## Common Functions

- ▶  $x:z$  will give you the sequence of integers from number  $x$  to number  $z$

`1:3`

# Common Functions

- ▶ `x:z` will give you the sequence of integers from number `x` to number `z`

```
1:3
```

- ▶ `seq(a, b, by = z)` will give you the sequence of numbers from number `a` to number `b` in increments of `z`

```
seq(1,3, by = 1)  
seq(0, 1, by = 0.1)
```

## Variables in R

- ▶ `<-` is the assignment operator

# Variables in R

- ▶ `<-` is the assignment operator
- ▶ `x<- y` *assigns* value `y` to object `x`

# Variables in R

- ▶ `<-` is the assignment operator
- ▶ `x<- y` *assigns* value `y` to object `x`

```
x <- 1:3  
x
```

# Variables in R

- ▶ `<-` is the assignment operator
- ▶ `x<- y` *assigns* value `y` to object `x`

```
x <- 1:3  
x
```

- ▶ `x` can be whatever we want it to be but can't start with numbers or contain spaces

# Variables in R

- ▶ We can use functions and perform arithmetic operations on our object assigned above

```
mean(x)  
summary(x)
```

# Types and Classes of Objects in R: Numeric

- ▶ Numeric Data:
  - ▶ Integers

```
class(x)  
typeof(x)
```

# Types and Classes of Objects in R: Numeric

- ▶ Numeric Data:

- ▶ Integers

```
class(x)  
typeof(x)
```

- ▶ Doubles

```
class(1.3)  
typeof(1.3)
```

# Types and Classes of Objects in R: Character

- ▶ Text Data:
  - ▶ Characters

```
"a"  
class("a")
```

# Types and Classes of Objects in R: Factor

- ▶ Categorical Data:
  - ▶ Store variables with categories as factor variables

## Types and Classes of Objects in R: Factor

- ▶ Categorical Data:
  - ▶ Store variables with categories as factor variables
  - ▶ Examples: Party identification, ideology, race, gender

```
party <- c("Republican", "Democrat",  
          "Independent", "Republican")  
class(party)  
party_factor <- factor(party,  
                        levels = c("Democrat",  
                                   "Independent",  
                                   "Republican"))  
class(party_factor)
```

# Types and Classes of Objects in R: Data Frames

- ▶ We often want to store multiple vectors containing different data in a cohesive format
  - ▶ `data.frame`

# Types and Classes of Objects in R: Data Frames

- ▶ We often want to store multiple vectors containing different data in a cohesive format
  - ▶ `data.frame`
- ▶ Columns are often called variables
  - ▶ Accessed using `$` operator
  - ▶ Example: `surveydata$party`

# Types and Classes of Objects in R: Data Frames

- ▶ We often want to store multiple vectors containing different data in a cohesive format
  - ▶ `data.frame`
- ▶ Columns are often called variables
  - ▶ Accessed using `$` operator
  - ▶ Example: `surveydata$party`
- ▶ Rows generally represent the observed values for each observation/individual
  - ▶ Accessed using `[]`
  - ▶ Example: `surveydata[1,]`

# Types and Classes of Objects in R: Data Frames

- ▶ We often want to store multiple vectors containing different data in a cohesive format
  - ▶ `data.frame`
- ▶ Columns are often called variables
  - ▶ Accessed using `$` operator
  - ▶ Example: `surveydata$party`
- ▶ Rows generally represent the observed values for each observation/individual
  - ▶ Accessed using `[]`
  - ▶ Example: `surveydata[1,]`
- ▶ Can access both columns and rows using `[]`
  - ▶ Example: `surveydata[row, column]`
  - ▶ Example: `surveydata$column[row]`

# Types and Classes of Objects in R: Logical

- ▶ Logical/Boolean Data:
  - ▶ TRUE or FALSE

```
class(TRUE)
class(FALSE)
class(c(TRUE, TRUE, FALSE))
```

# Logical Operators

- ▶ `==` tests whether one object is equivalent to another
- ▶ `!=` tests whether one object is **not** equivalent to another
- ▶ `<` (or `>`) tests whether one object is less than (or greater than) another
- ▶ `<=` (or `>=`) tests whether one object is less than or equal to (or greater than or equal to) another

```
2==2
```

```
2==3
```

```
2!=3
```

```
2<3
```

# Missing Data

- ▶ Missing data often appear as NA in R
- ▶ NA is a special type of logical object
- ▶ Sometimes have to remove NA values to calculate desired quantities

```
class(NA)
mean(c(1,2,3, NA))
mean(c(1,2,3, NA), na.rm = T)
```

# Missing Data

- ▶ Missing data often appear as NA in R
- ▶ NA is a special type of logical object
- ▶ Sometimes have to remove NA values to calculate desired quantities

```
class(NA)
mean(c(1,2,3, NA))
mean(c(1,2,3, NA), na.rm = T)
```

- ▶ Remember you can use ? to learn more about function arguments

## Example
